| Project Name | Measuring the pulse of prosperity:An index of economic freedom analysis |

## Solution Architecture:

The solution architecture for "Measuring the Pulse of Prosperity: An Index of Economic Freedom Analysis" is designed as a structured, data-driven analytical framework consisting of four main layers: data collection, data processing, index construction, and visualization & reporting. In the first layer, secondary data is collected from reliable international databases and economic reports covering key dimensions such as rule of law, government size, regulatory efficiency, and market openness, along with prosperity indicators like GDP per capita, employment rate, and investment levels. In the second layer, the collected data is cleaned, normalized, and standardized to ensure consistency across countries and years.

**Goals:**

1. To analyze the concept of economic freedom and understand its key components such as rule of law, regulatory efficiency, government size, and market openness.
2. To construct a composite Economic Freedom Index using selected economic indicators for comparative analysis across countries or regions.
3. To examine the relationship between economic freedom and prosperity, using measurable indicators such as GDP per capita, employment rate, investment levels, and business growth.
4. To compare and rank countries/regions based on their economic freedom scores to identify patterns, strengths, and weaknesses.
